

## Using real.leads in an iFrame Hosted On Another Website

To use web pages from your premier real.leads website within an i-frame of another site, do the following:

1. Identify a page that you want to use in the other site by navigating to it on your real.leads site. For example, the URL to the map-based property search page on a premier site is:

<http://rosemariedichiara.remaxinnovationsonline.com/propertysearch/propertysearchmap.aspx>

2. To make this a real.leads page suitable for framing, add the prefix “frames” in front of the name following the domain. For example, the above URL would be changed to:

<http://rosemariedichiara.remaxinnovationsonline.com/framespropertysearch/propertysearchmap.aspx>

3. Use that URL as the “frameout” address in the new website.

Using this technique, you can add many of real.leads exclusive features (including property search, interactive maps, property data sheets, MyHomeFinder, etc.) with another website’s content. All your reports and stats and remax.com referrals will continue to function normally.

The only caveat you should keep in mind is that any consumer who registers for a HomeFinder email will receive links back to your real.leads site, not the other site that you use to frame real.leads pages, as described here.
